

Databases

MS SQL

A Database stores both the database information as well as the security/login information

On Microsoft SQL Server Management studio go to the Security Folder. Right-click on a particular user can then go to User Mapping. Once your on User Mapping you can assign Users to Databases. Then once you have assigned a User to a particular database, such as assigning a user called Ben to Database "Car project"

Then go to the Database Car Project and select the level of Control that the User has for the Database Carproject.

To Recap:

There are two steps to assigning a user to a database:

- > Firstly you assign a user to a Database
- > Then go to the Database and edit the level of control that the particular user has.
